## Panel Distro Buy and Build Instructions

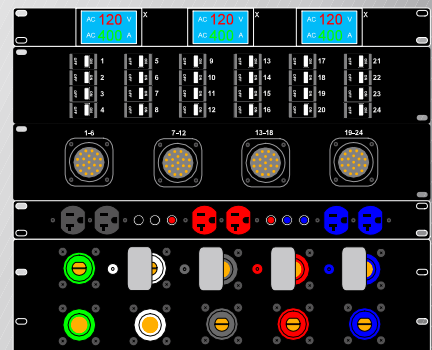

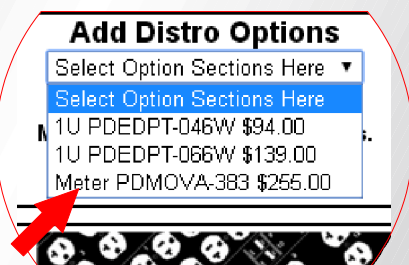

All of the inventory offered on the "Panel Distro" page replicates items found on "Rackables." Whereas Rackables (model numbers starting with an RB) are separate panel assemblies with 36" unterminated leads, Panel Distros uses model numbers starting with a "PD" indicating that they are part of a larger finished product. These instructions show step by step the process of adding to cart all of the items needed to fit your required panel distro.

Click on a graphic image regarding the primary connector/breaker type to open the PDF. There are model numbers below the images. Choose the model number in the drop down menu and add to cart.

Click the PDF button for Cam panels to find model number. Use the drop menu to add to cart. Remember to click the "RNG" button if necessary to Reverse Neutral and Ground. If this is the finished distro, click "proceed to checkout" at the bottom of the shopping cart and proceed.

Click the options PDF to see edison convenience and meter options. Add these items to cart and complete checkout. Since there are various locations these items can be integrated, A graphic image of the finished product will be sent before the build showing orientation.

An infinite number of combinations are available. Other connector/breaker panels can be added to checkout creating a distro that best fits your needs. Any combination of assemblies other than a connector/breaker panel with a single cam panel will require graphics sent to confirm the build. Panels and connectors not shown on the page are still available. Contact RTG Products for custom panel assemblies. See "Cases at Cost" to add an ATA case that fits the finished distro.
